

WORKSHEET 3.03 - SITUATION THREE

Compile existing site-specific data and determine existing site imperviousness (I_{EXIST}). For the purposes of these calculations, site area (A_{SITE}) is defined as the entire parcel. A_{EXIST} represents the actual amount of existing impervious cover on the site.

$$A_{SITE} = \underline{\hspace{2cm}} \text{ acres}$$

$$A_{EXIST} \text{ structures} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{parking lot} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{roadway} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{other} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{Total } A_{EXIST} = \underline{\hspace{2cm}} \text{ acres}$$

$$I_{EXIST} = (\text{Total } A_{EXIST} \div A_{SITE}) \times 100$$

$$I_{EXIST} = \underline{\hspace{2cm}} \% \text{ (expressed in whole numbers)}$$

Compile post-development site-specific data and determine post-development site imperviousness (I_{POST}). For the purposes of these calculations, site area (A_{SITE}) is defined as the entire parcel. A_{POST} represents the actual amount of impervious cover on the site once the proposed development is complete.

$$A_{SITE} = \underline{\hspace{2cm}} \text{ acres}$$

$$A_{POST} \text{ structures} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{parking lot} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{roadway} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{other} = \underline{\hspace{2cm}} \text{ acres}$$

$$\text{Total } A_{POST} = \underline{\hspace{2cm}} \text{ acres}$$

$$I_{POST} = (\text{Total } A_{POST} \div A_{SITE}) \times 100$$

$$I_{POST} = \underline{\hspace{2cm}} \text{ (expressed in whole numbers)}$$

If $I_{EXIST} > 16\%$ and the existing impervious area is not served by a BMP, proceed with calculation of pollutant loadings. Otherwise, refer to Section 3.4 of the Manual for correct development situation determination.

Calculate the pre and post-development pollutant loadings for the site using the Simple Method.

$$L = P \times P_J \times [0.05 + (0.09 \times I)] \times C \times A \times 2.72 / 12$$

Where:

- P_J = unitless rainfall correction factor
- = 0.9 for all of Tidewater, Virginia
- P = annual rainfall depth in inches
- = 43 for the Richmond Metropolitan Area
- C = flow weighted mean concentration of total phosphorus
- = 0.26 mg/l for the entire County
- $I_{WATERSHED}$ = average land cover condition of the Bay watershed
- = 16 percent

<p>Calculate the pre-development load (L_{PRE}):</p> $L_{PRE} = [0.05 + 0.009 \times I_{EXIST}] \times 2.28 \times A_{SITE}$ $= [0.05 + (0.009 \times \underline{\quad})] \times 2.28 \times (\underline{\quad})$ <p>$L_{PRE} = \underline{\hspace{2cm}}$ pounds per year</p>	<p>Calculate the load based on 16% impervious cover (L_{16}):</p> $L_{16} = [0.05 + 0.009 \times 16] \times 2.28 \times A_{SITE}$ $= [0.05 + (0.009 \times \underline{16})] \times 2.28 \times (\underline{\quad})$ <p>$L_{16} = \underline{\hspace{2cm}}$ pounds per year</p>
---	--

Calculate the post-development load (L_{POST}):

$$L_{POST} = [0.05 + 0.009 \times I_{POST}] \times 2.28 \times A_{SITE}$$

$$= [0.05 + (0.009 \times \underline{\hspace{2cm}})] \times 2.28 \times (\underline{\hspace{2cm}})$$

$L_{POST} = \underline{\hspace{2cm}}$ pounds per year

Calculate the pollutant removal requirement (RR). The removal requirement shall be the smaller of the following

$RR = L_{POST} - (0.9 \times L_{PRE})$ $= \underline{\hspace{2cm}} - (0.9 \times \underline{\hspace{2cm}})$ $= \underline{\hspace{2cm}}$ pounds per year	$RR = L_{POST} - L_{16}$ $= \underline{\hspace{2cm}} - \underline{\hspace{2cm}}$ $RR = \underline{\hspace{2cm}}$ pounds per year
--	--

RR = pounds per year
